

Term	Definition
AAA (Authentication, Authorization, and Accounting)	A framework that authenticates users, authorizes access to resources, and accounts for user activities.
ACS (Access Control Server)	A server used to manage access to network resources and enforce security policies.
Client	Software that sends requests to a server and processes the response, e.g., web browsers like Chrome or Firefox.
DNS (Domain Name System)	A hierarchical system for translating human-readable domain names into IP addresses.
FTP (File Transfer Protocol)	A protocol used to transfer files between a client and server over a network.
HTTP (Hypertext Transfer Protocol)	An application-layer protocol used for transmitting hypermedia documents, such as HTML.
HTTPS (Hypertext Transfer Protocol Secure)	The secure version of HTTP that uses encryption to protect data transmitted between a browser and server.
ISA/IEC (International Society of Automation/International Electrotechnical Commission)	Organizations that develop international standards for industrial automation and electrical systems.
NERC CIP (North American Electric Reliability Corporation - Critical Infrastructure Protection)	A set of standards to protect critical infrastructure in the North American electric power system.
NIST (National Institute of Standards and Technology)	A U.S. agency that develops and promotes standards for technology, science, and cybersecurity.
NNTP (Network News Transfer Protocol)	A protocol used to distribute, retrieve, and post news articles over a network.
RADIUS (Remote Authentication Dial-in User Service)	A protocol that provides centralized authentication, authorization, and accounting for network access.

Server	A host running a software application that provides information or services to other hosts connected to the network.
SFTP (Secure File Transfer Protocol)	A secure version of FTP that encrypts file transfers to prevent unauthorized access.
SSH (Secure Shell)	A secure protocol for remote command-line access and file transfers over a network.
TACACS (Remote Authentication Dial-in User Service)	A protocol used for centralized authentication of users accessing a network.
Telnet	An application-layer protocol for accessing devices remotely using a command-line interface; not secure.
URI (Uniform Resource Identifier)	A string of characters that identifies a specific network resource; it includes protocols, hostnames, and paths.
URL (Uniform Resource Locator)	Defines the network location of a specific resource on the network, typically used with HTTP or HTTPS.
URN (Uniform Resource Name)	Identifies the namespace of the resource without reference to the protocol.
VPN (Virtual Private Network)	A virtual private network that provides secure, encrypted communication over public networks.
